

Question 1 - Many Time Pad

Let us see what goes wrong when a stream cipher key is used more than once. Below are eleven hex-encoded ciphertexts that are the result of encrypting eleven plaintexts with a stream cipher, all with the same stream cipher key. Your goal is to decrypt the last ciphertext, and submit the secret message within it as solution.

Hint: XOR the ciphertexts together, and consider what happens when a space is XORed with a character in [a-zA-Z].

ciphertext #1:

2f904

For completeness, here is the python script used to generate the ciphertexts. (it doesn't matter if you can't read this)

```
import sys

MSGs = ( --- 11 secret messages --- )

def strxor(a, b):    # xor two strings of different lengths
    if len(a) > len(b):
        return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a[:len(b)], b)])
    else:
        return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a, b[:len(a)])])

def random(size=16):
    return open("/dev/urandom").read(size)

def encrypt(key, msg):
```

```
c = strxor(key, msg)

print

print c.encode('hex')

return c

def main():

    key = random(1024)

    ciphertexts = [encrypt(key, msg) for msg in MSGS]
```

Enter the decrypted message in the box below.

You entered:

The secret message is: When using a stream cipher, never use the key more than once
